SITE RESTORATION PLAN

FOR THE

HYON WASTE MANAGEMENT SITE

SCA CHEMICAL SERVICES, INC.

CONSULTING ENGINEER

JAMES DOUGLAS ANDREWS, P.E.

ENVIRONMENTAL ENGINEERING, INC.

SPRINGFIELD, ILLINOIS

NOVEMBER, 1980

PRELIMINARY
SITE RESTORATION PLAN

BACKGROUND

For approximately the past ten years a portion of the Lake Calumet area of the City of Chicago has been intermittently used as a processing site for industrial wastes. The site is an area of 30 acres and was operated as the Hyon Waste Management Company. Among the processing facilities is an industrial waste incinerator which is currently being modified for future use. Ancillary facilities include a series of ten bio-chemical filters and six impoundment basins formerly used for water treatment and storage.

SCA Chemical Services, Inc. (SCA) has assumed responsibility for the modification and operation of the industrial waste incinerator. Concurrent with the modification of the incinerator SCA proposes to convert the former bio-chemical filters and impoundment basins to useable space through a restoration project as described herein.

The firm of James Douglas Andrews, P. E.; Environmental Engineering, Inc. was retained in October 1980 to conduct a study of the portion of the site formerly used for the bio-chemical filters and impoundment basins. The study involves a subsurface investigation of the site to determine the nature of the fill materials which provide containment of the wastes at present. Also, analysis will be performed to determine the physical and chemical character of the materials in the former bio-chemical filters and the sediments in the impoundment basins.

SUBSURFACE INVESTIGATION

The subsurface investigation of the site consists of a series of three borings into and/or through the fill materials which form the peninsula. These borings will penetrate the clay base which is known to underlie the site at a depth of 15 to 20 feet.

In addition to the deep borings a series of 18 shallow auger borings are being made in the impoundment basins and the bio-chemical filter beds. These samples will be reviewed by the Consulting Engineer and a representative group will be selected for further analysis.

WASTE REMOVAL AND DISPOSAL

The aqueous materials in the impoundment basins have been analyzed and are being discharged to the MSDGC sewer available at the site. It is unknown at this time whether the bio-chemical filter leachate may be suitable for discharge. Analysis have been performed to determine the suitability of the leachate for disposal into the sewer. Results of these analyses are under current study. In the event discharge to the sewer is inappropriate for any of the aqueous wastes they will be collected and stored on the site in suitable vessels until disposal at a permitted facility occurs.

The relatively thin underlayment of clay material in the bio-chemical filter beds and impoundment basins makes the removal of wastes and sludges from these areas a delicate operation requiring close supervision. It is important that these operations occur with little or no penetration of the clay underlayment to avoid migration of pollutants into the permeable materials underneath and,

ultimately, to the waters in Lake Calumet. The sub-surface investigation currently underway will indicate the type of equipment to be used in removing materials from these areas.

It is estimated that bio-chemical filter bed solid wastes and bottom sludges removed from the impoundment basins will amount to approximately 22,500 cubic yards.

Basin I is reported to be lined with a five foot, or more, thickness of relatively impermeable clay. The ongoing subsurface investigation will confirm or disprove this report. The capacity of Basin I, if filled to a depth of six feet, is approximately 24,000 cubic yards. Basin II is reported to be an auxiliary basin which was not used extensively, if at all, for containment of wastes or waste water. If this basin is also available for placement of a clay liner and deposit of solid wastes, it appears certain that most, or all, of the bio-chemical filter bed solids and bottom sludges from the impoundment basins may be successfully contained on-site in these two lined basins.

SITE CLOSURE AND CAPPING

After placement of wastes in the lined impoundment basin (s) the entire area will be leveled by placement of inert fill including dirt, stone and concrete. A final cover consisting of a minimum two feet of clayey material and six inches of topsoil will be placed over the entire affected area. The surface will be contoured for drainage to the outer perimeter of the peninsula. Slopes are to be not in excess of two percent to maintain a sheet-wash runoff. The site will be revegetated with shallow-rooted grasses.

POST - CLOSURE MONITORING

The site is currently equipped with eight groundwater monitoring wells. The depths and other essential dimensions of the wells are being determined as a part of the subsurface investigation. If necessary, additional groundwater monitoring wells will be added.

A program of monitoring and reporting will be presented to IEPA for review and approval as a portion of the Final Site Restoration Plan.

CONTINGENCY PLAN

In the event analysis of waste materials and/or bottom sludges at the subject site reveals the presence of materials clearly unsuitable for land disposal on this property an alternative disposal method will be proposed.

The Final Restoration Plan will include a more comprehensive Contingency Plan for responding to potential failure of the closed and covered site. Conditions at the site, coupled with regular monitoring and maintenance should avoid any extensive environmental damage due to site failure.
